## Glossary

---

The terms listed below are generally restricted to those that have been adopted specifically for use within WeBS or more widely for monitoring.

**Autumn** For waders, autumn comprises July to October inclusive. Due to differences in seasonality between species, a strict definition of autumn is not used for wildfowl.

**British Trust for Ornithology (BTO)** The BTO is a well-respected organisation, combining the skills of professional scientists and volunteer birdwatchers to carry out research on birds in all habitats and throughout the year. Data collected by the various surveys form the basis of extensive and unique databases, which enable the BTO to objectively advise conservation bodies, government agencies, planners and scientists on a diverse range of issues involving birds.

**Complex site** A *WeBS* site that consists of two or more *sectors*.

**Core Counts** The fundamental WeBS counts that monitor all types of wetlands throughout the UK once per month on priority dates. Used to determine population estimates and trends and identify important sites.

**Local Organiser** Person responsible for coordinating counters and counts at a local level, normally a county or large estuary, and the usual point of contact with the *WeBS* office.

**Incomplete counts** When presenting counts of an individual species, a large proportion of the number of birds was suspected to have been missed, e.g. due to part coverage of the site or poor counting conditions, or when presenting the total number of birds of all species on the site, a significant proportion of the total number was missed.

**I-WeBS** An independent but complementary scheme operating in the Republic of Ireland to monitor non-breeding waterbirds, organised by the IWC BirdWatch Ireland, the National Parks and Wildlife Service (Ireland) and The Wildfowl & Wetlands Trust.

**Joint Nature Conservation Committee (JNCC)** JNCC is the statutory body constituted by the Environmental Protection Act 1990 to be responsible for research and advice on nature conservation at both UK and international levels. The committee is established by English Nature, Scottish Natural Heritage and the Countryside Council for Wales, together with independent members and representatives from the Countryside Commission and Northern Ireland, and is supported by specialist staff.

**Low Tide Counts (LTC)** WeBS counts made at low tide to assess the relative importance of different parts of individual estuaries as feeding areas for intertidal waterbirds.

**Royal Society for the Protection of Birds (RSPB)** The RSPB is the charity that takes action for wild birds and the environment in the UK. The RSPB is the national BirdLife partner in the UK.

**Spring** For waders, spring comprises April to June inclusive. Due to differences in seasonality between species, a strict definition of spring is not used for wildfowl.

**Waterbirds** WeBS follows the definition adopted by Wetlands International. This includes a large number of families, those occurring regularly in the UK being divers, grebes, cormorants, herons, storks, ibises and spoonbills, wildfowl, cranes, rails, waders and gulls and terns.

**WeBS count unit** The area/boundary within which a count is made. The generic term for *sites*, *sub-sites* and *sectors*.

**WeBS Office** Main administrative centre for the day-to-day running of WeBS and main point of contact for information or data pertaining to WeBS (see *Contacts* section).

**WeBS sector** The unit of division of large *sites* into areas that can be counted by one person in a reasonable time period. They are often demarcated by geographic features to facilitate recognition of the boundary by counters. The finest level at which data are recorded.

**WeBS site** A biologically meaningful area that represents a discrete area used by waterbirds such that birds regularly move within but only occasionally between sites. The highest level at which count data are stored.

**WeBS sub-site** A grouping of *sectors* within a *site* to facilitate coordination. In most cases, sub-sites also relate to biologically meaningful units for describing waterbird distribution.

**WeBS Year** Defined as July to June inclusive the WeBS Year is centred on the time when most waterbird species are present in their largest number, during winter. Counts during autumn passage and spring passage the following calendar year are logically associated with the intervening winter.

**Wildfowl & Wetlands Trust (WWT)** Founded by Sir Peter Scott in 1946, WWT is the largest wildlife conservation charity specialising in wetlands and the wildlife they

support in the UK. It has pioneered the bringing together of people and wildlife for the benefit of both and seeks to raise awareness of the value of wetlands, the threats they face and the actions needed to save them. To this end, WWT has eight centres throughout the UK and is dedicated to saving wetlands for wildlife and people.

**Winter** For waders, winter comprises November to March inclusive. Due to differences in seasonality between species, a strict definition of winter is not used for wildfowl.

**1% criterion** The Ramsar Convention has established site selection criteria. Criterion 6 states that “. . . a wetland should be considered internationally important if it regularly supports 1% of the individuals in a population of one species or subspecies of waterbird”.

**1% threshold** This logically derives from the *1% criterion* and relates to the number of birds that are used as the nominal 1% of the population for the purposes of site selection. Thus, an international population of 75,215 Shelduck has a derived 1% threshold (adopting rounding conventions) of 750.

# Appendices

## APPENDIX 1. INTERNATIONAL AND NATIONAL IMPORTANCE

Any site recognised as being of international ornithological importance is considered for classification as a Special Protection Area (SPA) under the EC Directive on the Conservation of Wild Birds (EC/79/409), whilst a site recognised as an internationally important wetland qualifies for designation as a Ramsar site under the Convention on Wetlands of International Importance especially as Waterfowl Habitat. Criteria for assessing the international importance of wetlands have been agreed by the Contracting Parties to the Ramsar Convention on Wetlands of International Importance (Ramsar Convention Bureau 1988). Under criterion 6, a wetland is considered internationally important if it regularly holds at least 1% of the individuals in a population of one species or subspecies of waterbird, while criterion 5 states that any site regularly supporting 20,000 or more waterbirds also qualifies. Britain and Ireland's wildfowl belong, in most cases, to the northwest European population and the waders to the east Atlantic flyway population (Wetlands International 2002).

A wetland in Britain is considered nationally important if it regularly holds 1% or more of the estimated British population of one species or subspecies of waterbird, and in Northern Ireland important in an all-Ireland context if it holds 1% or more of the estimated all-Ireland population.

The 1% thresholds for British, all-Ireland and international waterbird populations, where known, are listed in Table A1. Thus, any site regularly supporting at least this number of

birds potentially qualifies for designation under national legislation, or the EC Birds Directive or Ramsar Convention. The international population for each species and subspecies is also specified in the table. However, it should be noted that, where 1% of the national population is less than 50 birds, 50 is normally used as a minimum qualifying threshold for the designation of sites of national or international importance.

It was agreed at the meeting of the Ramsar Convention in Brisbane that population estimates will be reviewed by Wetlands International every three years and 1% thresholds revised every nine years (Rose & Stroud 1994; Ramsar Resolution VI.4). 1% thresholds have not been derived for introduced species since protected sites would not be identified for these birds.

Sources of qualifying levels represent the most up-to-date figures following recent reviews: for wildfowl in Britain see Kershaw & Cranswick (2003); for waders in Britain see Rehfish *et al.* (2003); for gulls in Britain see Burton *et al.* (2003); for all-Ireland importance for divers see Danielsen *et al.* (1993) and for other waterbirds see Whilde (*in prep.*) cited in Way *et al.* (1993). International criteria follow Wetlands International (2002).

It should be noted that for some populations, where the British total is the international total, the precise figure given for the estimates may differ because of different rounding conventions applied in the relevant publications.

Table A1. 1% thresholds for national and international importance

	Great Britain	all-Ireland	International	Subspecies/Population
Red-throated Diver	49	*10	10,000	NW Europe (non-br)
Black-throated Diver	*7	*1	10,000	<i>arctica</i>
Great Northern Diver	*30	?	50	NW Europe (non-br)
Little Grebe	78	?	3,400	<i>ruficollis</i>
Great Crested Grebe	159	*30	4,800	<i>cristatus</i>
Red-necked Grebe	*2	?	1,000	<i>grisegena</i> , NW Europe (non-br)
Slavonian Grebe	*7	?	35	<i>auritus</i> , NW Europe (large billed)
Black-necked Grebe	*1	?	2,800	<i>nigricollis</i> , Europe, N Africa
Cormorant	230	?	1,200	<i>carbo</i> , NW Europe
Shag	?	?	2,400	<i>aristotelis</i>
Little Egret	?	?	1,300	<i>garzetta</i> , W Europe, NW Africa
Grey Heron	?	?	2,700	<i>cinerea</i> , W Europe, NW Africa (br)

Table A1. continued

	Great Britain	all-Ireland	International	Subspecies/Population

? Population size not accurately known.

+ Population too small for meaningful figure to be obtained.

\* Where 1% of the British or all-Ireland wintering population is less than 50 birds, 50 is normally used as a minimum qualifying level for national or all-Ireland importance respectively.

\*\* A site regularly holding more than 20,000 waterbirds qualifies as internationally important by virtue of absolute numbers.

- 1 The degree of interchange of UK Eiders with birds on the continent is unclear, and although Wetlands International (2002) has recommended that birds in Britain and Ireland should be treated as a separate biogeographical population, a recent review of available data by DEFRA's SPA and Ramsar Scientific Working Group has found limited evidence to support this conclusion, and recommended that for site-selection purposes, British Eider continue to be considered as a component of the four groups of the Northwest European groups of the race *mollissima* with an international 1% threshold of 15,500. It is hoped that future genetic studies will help clarify the situation.
- 2 Although Wetlands International (2002) considers Goosanders breeding in Scotland, northern England and Wales to be a discrete population, a recent review of available data by DEFRA's SPA and Ramsar Scientific Working Group has found limited evidence to support this conclusion for the time being, and recommended that for site-selection purposes, British Goosanders continue to be considered as a component of the NW and C European population of Goosander, with an international 1% threshold of 2,700.
- 3 Three populations of Golden Plover listed by Wetlands International (2002) overlap in the UK in winter. Draft guidelines from Ramsar suggest that the largest of the three thresholds (*i.e.* that for *altifrons*, Iceland & Faeroes, E Atlantic) should be used for site-selection purposes.
- 4 Whilst several populations of Dunlin occur in the UK at different times of the year, most wintering birds are referable to the listed population.
- 5 Three populations of Redshank listed by Wetlands International (2002) overlap in the UK in winter: *totanus* E Atlantic (non-br), *robusta* and *britannica*. Most *totanus* winter outside the UK but the other populations are known to occur widely. Draft guidelines from Ramsar suggest that the larger of the two thresholds (*i.e.* that for *britannica*) should be used for site-selection purposes.
- 6 Two populations of Herring Gull overlap in the winter in the UK; *argentatus* and *argenteus*. Draft guidelines from Ramsar suggest that the larger of the two thresholds, *i.e.* that for *argentatus*, should be used for site-selection purposes.

## APPENDIX 2. LOCATIONS OF WeBS COUNT SITES MENTIONED IN THIS REPORT

Table A2 provides details of all WeBS sites that are mentioned in this report. Sites are listed alphabetically, with details of the Ordnance Survey 1-km square that the centre of the sites falls into and the region also provided. Principal Core Count sites, as listed

in Table 6, are highlighted in **bold**. Numbers following Principal Core Count sites refer to the sites' location in Figure A1.

Note that this is not an exhaustive list of sites counted during 2004/05, simply those mentioned in this report.

Table A2. Details of sites mentioned in this report. Numbers following Principal Core Count sites refer to the sites' location in figure A1.

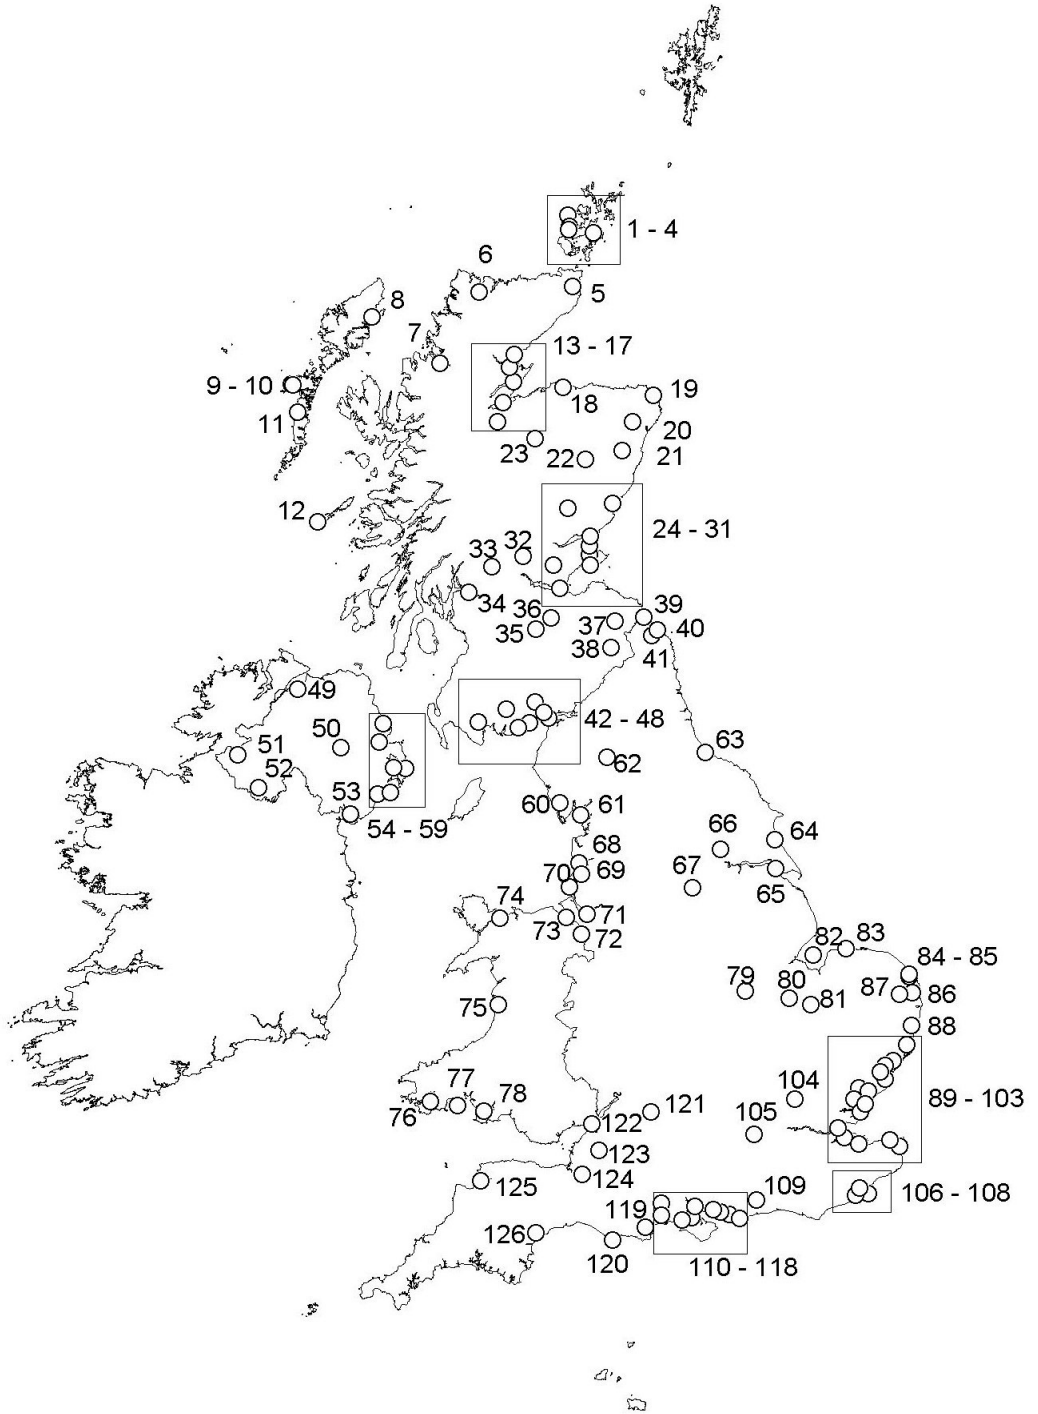

Figure A1. Locations of Core WeBS sites supporting more than 10,000 waterbirds or which support internationally important numbers of one or more waterbird species (see *PRINCIPAL SITES*). Numbers refer to sites listed in Table A2.

### APPENDIX 3. WATERBIRDS RECORDED BY WeBS BETWEEN APRIL AND JUNE 2004

As a result of the change in the WeBS Year from April-March, to July-June, a short summary of key findings from April-June 2004 is presented here. If further information is required, please contact the WeBS Office at the BTO.

The total numbers of waterbirds recorded by WeBS between April and June 2004 are given in Tables A3 and A4 for Great Britain (including the Isle of Man, but excluding the Channel Islands) and Northern Ireland, respectively.

A single Bean Goose was recorded at Hornsea Mere in April, whilst another was present at Hauxley Haven. A large number of Pink-footed Geese was still present in April with flocks of 5,400 at Loch of Strathbeg, 3,500 at Morecambe Bay and about 1,500 each at the Ribble and Solway Estuaries. Similarly, Barnacle Geese were still present in considerable numbers in April with 9,338 on the Solway Estuary and 2,750 at Mersehead RSPB. By May there were still 2,250 on the Solway Estuary, although these had all left the site by June.

More than 7,500 Dark-bellied Brent Geese were counted on The Wash during April. By May this number had fallen to just over 6,100 and by June only nine birds remained at the site. Up to 57 Light-bellied Brent Geese were recorded at Lough Foyle in April, after which time no Brents were recorded in Northern Ireland until the following September.

Over 600 Wigeon were present at Breydon Water and Berney Marshes in April. This figure had dropped to 151 in May and only three in June. Additionally, 969 Teal were present at this site in April. Over 2,000 Common Scoter remained off the North Norfolk Coast during May and June.

A total of 126 Red-throated Divers were recorded at the Inner Firth of Clyde during April. During the same month 19 Black-throated and five Great Northern Divers were at Gerrans Bay. A total of nine Red-necked and 19 Slavonian Grebes were recorded at the Forth Estuary in April; this was also the top month for Black-necked Grebe with 23 at Woolston Eyes and 17 at a further known

breeding site. Bittern were recorded at a total of six sites between April and June; all records were of single birds except for six at Minsmere in April. There was a single Glossy Ibis on the Exe Estuary in April and up to 12 Spoonbill on the Orwell Estuary in June.

Avocet numbers peaked at 591 at the North Norfolk Coast in April. The May total of Ringed Plovers at the Humber Estuary totalled 1,004. Dotterel were recorded at the Duddon Estuary in April (two) and The Wash in May (46). Grey Plover numbers peaked in May at the Wash with a total of 12,442 recorded; by June only 39 remained. Between April and May Knot numbers fell from over 20,000 to around 7,000 at two of the key sites for this species, the Ribble Estuary and The Wash; by June this figure had fallen to around 4,000. Numbers of Sanderling at the Ribble Estuary fell from 4,477 in April to 2,270 in May before rising slightly to 2,908 in June. Three Little Stints were at Toft Newton Reservoir in May. Temminck's Stints were recorded at four sites, all singles except for two at East Chevington Pools in May. Ruff numbers peaked in April with 57 at the North Norfolk Coast, 19 at the Ouse Washes and 18 at Breydon Water and Berney Marshes. Bar-tailed Godwit numbers fell from 4,662 in April to 2,199 in May. By June the summed site maximum was 756, over half of which were recorded at Humber Estuary, the North Norfolk Coast and The Wash. The highest single-site Core Count total of Whimbrel was 298 at the Exe Estuary in May. Up to 31 Spotted Redshank and 34 Greenshank were at Breydon Water and Berney Marshes and The Wash, respectively, in May. Green Sandpiper were recorded at just five sites during May; compared to 27 in April; all records were of single birds. By June this species was recorded from 40 sites, the highest single count was of six at Beddington Sewage Farm. Wood Sandpiper were recorded at nine sites between April and June; all were singles except for three at Loch of Strathbeg in May and two at Minsmere in April. A single Red-necked Phalarope was present at the Swale Estuary in May.
