

WINTER GULL ROOST SURVEY INLAND KEY SITE COUNT FORM

INTRODUCTION

The Winter Gull Survey (WinGS) for 2023/24–2024/25 has returned after a gap of 20 years. The last survey took place from 2003/04–2005/06 and concluded that the UK and near-shore coastal waters supported over 3.8 million wintering gulls at that time. Updated information on population trends is necessary to contribute to and inform effective conservation actions for gulls (*Bird Study* 13, 60:1, 87-101).

The 2023/24–2024/25 Winter Gull Roost Survey (WinGS) aims to produce total winter (January) gull population estimates for the UK. To do this the survey will cover **a.** Inland and Coastal Key Sites **b.** Randomly Selected Inland Samples and **c.** Randomly Selected Coastal Samples. Key Sites were identified from previous winter gull roost surveys and other recent reports.

The populations of gulls in the UK vary considerably over seasons. In order to investigate this change, we encourage additional Key Sites counts throughout autumn. We would also welcome Supplementary Counts from other smaller roosts throughout the survey period.

INSTRUCTIONS

Please read these instructions carefully before making your visit.

- THIS FORM IS FOR RECORDING SINGLE COUNTS OF ROOSTING GULLS AT INLAND KEY SITES IN JANUARY 2024. Additional counts for Key Sites should be recorded on Supplementary Count Forms.**
- SITE MAP: Ask your WinGS Organiser to download and print your site map from WinGS Online.** Your **WinGS Site** defined on the map will include one **Inland Key Sites** for which counts are required. You may also wish to supply separate roost counts for other sites (waterbodies, flooded fields etc) within this area. You may do so only if this does not intersect another count area (denoted by a black line on your map). Please attach your map to this count form with annotations of the observer position and location of the roost / flight lines.
- COUNTER DETAILS:** Please fill in your details and the name of your local co-ordinator.
- DATE & TIME: Key Sites require a single visit in January.** Record the date of your visit overleaf and then the approximate start and finish times using the 24-hour clock (e.g. 1500, 1700). You should aim to start your roost count about 2 hours before dark and should stop as soon as it is too dark to count. If counting a sub-site, ideally all sites should be visited on the same day, or if not within one week of each other. If counting a Team Site, counts should be coordinated with other observers.
- COUNTS:** Counts should be made for each of the species arriving at the roost up until dark, though should take into account any birds that may have departed before then. Record the numbers for each Count Site in the table opposite your map. If there were no gulls present but the site was visited, then please put a ✓ in the box at the top of the table. Please **do not** attempt to estimate the numbers of gulls that may have joined the roost after dark or any that may have left after dark.

The best method of counting gulls at roosts is to count birds on the flight lines going to roost. Counting birds on the water can be very difficult especially if there is any wind. Please be aware if you are counting any sub-sites or team sites that may necessitate coordinated counting efforts. It may be necessary to familiarise yourself with the site before the survey date.

If it was not possible to distinguish between Black-headed Gulls, Common Gulls and Mediterranean Gulls, during all or part of the count, or on a particular flight line, please provide a count of '**Unidentified Small Gulls**'. Likewise, if it was not possible to distinguish between Lesser Black-backed Gulls, Herring Gulls and Great Black-backed Gulls during all or part of the count, please provide a count of '**Unidentified Large Gulls**'.

If it was not possible to identify birds to species or place them into one of these size classes, counts should be entered as '**Unidentified (unspecified)**'. Any species noted that are not on the list should be recorded as '**Other Species**' – please specify what these are (i.e. Glaucous Gull, Yellow-legged Gull, Kittiwake).

If the site was not visited but the count of gulls is assumed to be zero based on habitat, please put a ✓ in the box at the bottom of the table (please only submit assumed zeros after consulting with your WinGS Organiser).

Make a note of whether your site had any ice cover and whether, in your opinion, counts were lower than expected due to weather conditions or disturbance.

PLEASE RETURN FORMS (EVEN IF YOU VISITED THE SITE AND SAW NO GULLS) BY 28 FEBRUARY 2024, EITHER TO YOUR LOCAL CO-ORDINATOR OR TO: WinGS, The Wetland & Coastal Ecology Unit, BTO, The Nunnery, Thetford, Norfolk IP24 2PU.

COMPLETING THIS PAGE: Please record your name and address and the name of your local co-ordinators at the top.

Insert visit date and times and your gull counts in the table below. If species identification was not possible, use the most suitable category (e.g. Unidentified Small Gull) – see instructions. Please record the numbers of gulls roosting within your site. If the site was visited and no gulls were present, please tick the box above the column. If you split your count unit into smaller count units, please use separate columns to count them and notate your printed map with this information.

Please also make a note of ice cover and inform us whether the numbers of gulls counted may have been affected by weather conditions, visibility or disturbance.
